High-Performance Active Optical Cables for AI, HPC & Data Centers

NET's Active Optical Cables (AOCs) deliver high-speed, low-latency connectivity for AI clusters, HPC environments, and hyperscale data centers. Designed for reliability and efficiency, ENET AOCs provide plug-and-play performance with industry-leading compatibility, power efficiency, and cost savings. Upgrade your network with lightweight, high-bandwidth optical connectivity.

END-TO-END SOLUTIONS

TRUSTED INDUSTRY LEADER

10G, 25G, and 40G AOCs

Available in SFP+, QSFP, and QSFP+ form factors, ENET's 10G, 25G, and 40G AOCs provide high-speed, low-latency optical links, ideal for server-to-switch, inter-rack, and edge computing connections in data centers and enterprise networks.

100G AOCs

ENET's 100G AOCs in QSFP28 form factors deliver high-bandwidth, energy-efficient optical connections, optimized for AI clusters, cloud computing, and hyperscale data center deployments.

200G AOCs

Supporting next-generation data requirements, ENET's 200G AOCs in QSFP56 form factors ensure scalable, high-capacity optical connections for short- to medium-range networking within high-performance environments.

400G AOCs

ENET's 400G AOCs in QSFP-DD form factors provide ultra-fast, reliable optical connectivity designed for hyperscale data centers, HPC applications, and AI-driven environments with low latency and high signal integrity.

800G AOCs

Offered in OSFP and QSFP112 form factors, ENET's 800G AOCs deliver the highest optical performance for short-range, high-bandwidth links, meeting the demands of cutting-edge AI clusters and hyperscale networks.

Major OEMs supported among 100+

CISCO · Mellanox TECHNOLOGIES · NVIDIA · IBM · DELL Technologies · ARISTA · aruba NETWORKS · intel · JUNIPER NETWORKS · FORTINET · paloalto NETWORKS

BREAKOUT AOCS:

ENET's breakout active optical cables (AOCs) deliver high-speed optical connections while splitting high-capacity ports into multiple lower-speed outputs, such as 100G to 4x25G or 400G to 4x100G configurations. Designed for longer-range connectivity compared to DACs, breakout AOCs extend reach between switches, servers, and other equipment in multi-vendor environments. With superior bandwidth and low power consumption, they are ideal for hyperscale, AI-driven networks, and enterprise deployments requiring flexible resource allocation and efficient bandwidth distribution.
